

## Thy-Rox

Hypothyroid or under active thyroid function is becoming a very common condition, affecting far more women than men. Statistics show that at least five percent of the total population suffers from clinically low thyroid function and another five percent are what is often termed 'borderline', and go untreated.

Symptoms and signs of an under-active thyroid include anemia, brittle nails, cold intolerance, dry or coarse hair, dry skin, hair loss, low body temperature, excess bodyweight and overall weakness, to name a few.

Tens of thousands of people are taking thyroid medications, mostly synthetic, and still don't experience the complete response that they feel they should. This is due to many factors, one of which is that the body oftentimes has difficulty recognizing and utilizing oral thyroid hormone, especially if it is of the synthetic variety. Our new formulation will not replace thyroid hormone therapy, but helps the body to utilize the medications more effectively, so it is of great potential importance to this vast group of individuals. For those 'borderline' cases, the formulation often makes the difference they need, by helping the body to naturally increase its own thyroid output.

There are many adjunct co-factors that can affect the thyroid gland such as systemic candida or yeast, trace mineral imbalances, and excess body toxins. Each of these problems may need to be explored and addressed if necessary.

If you are dealing with an under-active thyroid, you may wish to consider providing the body with the raw materials it needs and uses to manufacture thyroid hormone, while nourishing and supporting the thyroid gland in the process.

**Thy-Rox:** According to the research of such nutritional authorities as Dr Broda Barnes, MD and Jonathan Wright, MD, millions of people, especially women, may be suffering from low thyroid function. Even those currently taking thyroid medication often are either not getting the right dose or their body's may not be able to properly utilize the medication as effectively. For millions of others, their clinical testing is not low enough to be given thyroid medication, even though they likely would benefit from it.

The formula that we have developed is designed to be used by those who have been diagnosed with low thyroid function, whether they are currently taking medication or not. Designed to provide the raw materials the body needs to help establish a more normal thyroid function, this formula may be used to support any health building program. \*
